MIMER

2000-05-29

Sysdeco Mimer AB develops, markets and supports the relational database management system MIMER. Product development and support, as well as marketing and sales are handled from Uppsala, Sweden. Sysdeco Mimer's international activities are monitored from Uppsala via a number of distributors. There are today tens of thousands of MIMER-users around the world.

One focus for the company is to allow the database handler to be packaged with applications. These applications range from Software development tools all the way to embedded database applications.

The project "Embedded Databases for Embedded Real-Time Systems" focuses on how to incorporate database functionality into small real-time systems where the amount of resources are very small. Current database technology in the market does not match the requirements of these small systems. However, the market segment is continuously growing due to the massive number of embedded systems, so good exploitation opportunities in industry are promising. We strongly recommend support for the project.

Sysdeco Mimer AB
