Letter of support

Volvo Construction Equipment Components AB develops components for the design of construction equipment. One of the components provided is the electrical system of the vehicle, which nowadays is a distributed computer based system. The amount of information that is handled by this system is increasing for every new model. Up till now we handle the data by own developed methods. However, we would benefit of a methodological way of handling data by e.g. embedded real-time database approach.

Therefore, we strongly support the project Embedded Databases for Embedded Real-Time Systems. We are also happy to give industrial requirements to the suggested approach and provide case studies to evaluate the approach on.

Volvo Construction Equipment Components AB
