

Letter of support

Datex-Engström AB supports the TATOO (Test And Testability Of distributed real-time systems) research project.

Test methods and tools that enable measurement of testability could improve the quality of our products. A significant part of the development of our products goes into verification and validation of non sequential programs. It would be of great use to us, to have test methods, tools, and testability metrics that gives criteria on when to stop testing, and input on how to design for high testability.

We would gladly provide industrial experience and real-world applications as input to this project, and want to make use of the results.
